Abstract

The invention relates to a storage compartment (1) for a vehicle, having a storage compartment cover (2) which is pivotably mounted toward two sides. The latter can be pivoted either toward one side or toward the other side.

In order to design the storage compartment (1) such that it can be operated as simply and conveniently as possible and is secure, provision is made for the storage compartment cover (2) to have two locked axes of rotation (21, 22) in its closed position. After one axis of rotation (21) is released, a driving device (3) automatically pivots the storage compartment cover (2) in a damped manner into an open position.
